Sample report

Sample match (invented data). Doubles, 2 games.

Player analysed	navy top, white shorts ("you" in this report), right-handed
Partner	black top, black shorts
Opponents	two players in blue and red tops
Result	Invented scores, yours first: 21-17 and 19-21. There is no score on screen in a real video of this kind.

This is a sample

SAMPLE REPORT. Nobody played this match: two games of doubles were simulated and every number, chart and sentence below comes from invented data, made only to show what the report looks like. The scores are invented too.

What this report can and cannot tell you

The video has no scoreboard, so it does not know who won each rally, who served, what shot was played or where the shuttle landed. Everything here comes from where the four players were and from the sound of the shuttle: positions, formations, movement, and how long plays and pauses lasted.

That makes it good for 'where do we stand and how do we move' and not for 'which shot loses us points'. Each pattern is a question to check on the video, not a verdict.

The short version

Work on	Try going front and back more often
Work on	Spread out a little when defending
Check on video	Who plays the back court, and is it on purpose?
Working well	Your racket hand is up and ready
Opponents	Wide sidelines

The games at a glance

	Game 1	Game 2
Result	21-17	19-21
You were on the	near half of the video	far half of the video
Plays found	38 (card implies 38)	40 (card implies 40)
Typical play	6.9 s (longest 14 s)	6.9 s (longest 18 s)
Plays under 5 s / over 10 s	24% / 18%	20% / 18%
Typical pause between plays	6.2 s	6.5 s
Time in play	52%	53%
You: metres per play-minute	56	60 (far: reads high)
You: fast bursts per play-minute	0.9	2.4
Partner: metres per play-minute	59	58 (far: reads high)
Partner: fast bursts per play-minute	3.4	2.0

A 'fast burst' is a move above 2.5 m/s that lasts at least 0.3 s. Distances use tracks smoothed over one second, so small shuffles are not counted.

Your coaching plan

Each item says what to try and how sure the number behind it is. These notes were written automatically by rules from the numbers in this report; an AI assistant can write a more personal version (see CLAUDE.md).

Work on

1 Try going front and back more often

Your pair stood front-and-back (one of you at least 2.5 m deeper than the other) for only 6% (game 1) and 13% (game 2) of play, and the front court (the first 2.2 m from the net) held you for 0% (game 1) and 4% (game 2) of the time. Most of the time you were side by side in the middle of your half (85% (game 1) and 76% (game 2)). The video cannot show whether you were attacking or defending at those moments, so this is a question, not a verdict.

Try next time: In a practice game, agree that after an attacking shot (a smash or a steep drop) one of you steps in to the net and the other holds the back, then compare how those rallies go with your usual side-by-side ones.

Watch the longest plays listed at the end of this report and notice who is where when you hit downwards.

Where you stood: solid when you were near the camera, a little rougher in depth when far. Why you stood there: not measured.

2 Spread out a little when defending

You and your partner were usually only 1.4 m (game 1) and 1.4 m (game 2) apart across the court and within 1.5 m of each other for 55% (game 1) and 55% (game 2) of play. Splitting the width of the court in half would put you about 3 m apart. A narrow pair leaves wide gaps at both sidelines. The opponents did the same (48% (game 1) and 56% (game 2) of the time within 1.5 m), so it may be normal at this level, but it is also a gap that a wide cross-court shot can find.

Try next time: When you defend side by side, aim to stand about half the court width apart and each own your half, with the middle shared by whoever has the forehand.

Solid when you were near the camera; approximate when far.

Check on the video

3 Who plays the back court, and is it on purpose?

When you did go front and back, you were the one at the back in 88% and 61% of those moments: your partner was mostly the front or middle player. The back-court job swapped between you 1 (game 1) and 4 (game 2) times. That is a consistent split, which is good if you chose it. It is worth checking that the swaps happen cleanly and that you are not both left in the mid-court when the shuttle goes to the back.

Look for rallies in the longest plays where both of you are in the middle of the court at the same time.

Approximate: it rests on the share of play when you were front and back.

4 Stand a little lower in your ready position

Your knees were bent below 150 degrees in only 19% of the body-point samples (your partner 12%); the rest of the time you were standing upright or walking. Your feet were about 1.4 shoulder widths apart. A lower, wider base helps you push off quickly in any direction.

Try next time: Between shots, sink a little at the knees with the weight on the balls of your feet, so the first step comes from a loaded position.

Approximate. It uses a body-point model on frames where you were close to the camera (about 1,281 samples); the view from behind makes knee angles less exact.

Working well

5 **Your racket hand is up and ready**

Your racket hand was held up (wrist above your hip) in 82% of the body-point samples, and your partner's in 88%. That is a good habit in doubles, where the shuttle comes back fast. That is the hand you told us you use (right).

Approximate, from about 1,281 samples of you.

6 **You keep your work rate steady**

You moved 51 to 59 metres per minute of play across all the 2-minute blocks, with no steady fade. Over a whole game you averaged 56 (game 1) and 60 (game 2) metres per play-minute, your partner 59 (game 1) and 58 (game 2).

Approximate: each block holds about a minute of play. Numbers for a game where you are on the far half read a little high.

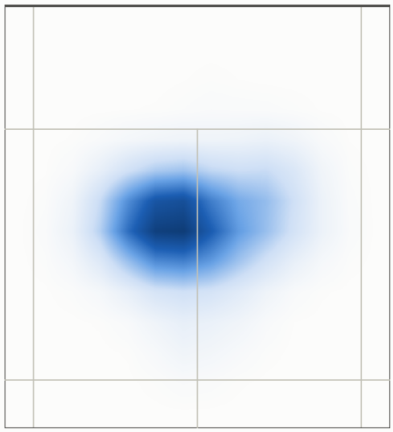

Where you play

Heat maps of the time each player spent in each part of their own half, during play only.

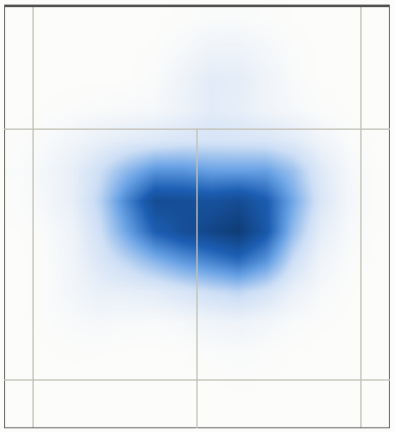

Where you and your partner stand

Your own half, seen from behind: net at the top, baseline at the bottom, your left on the left. Darker = more time (play only).

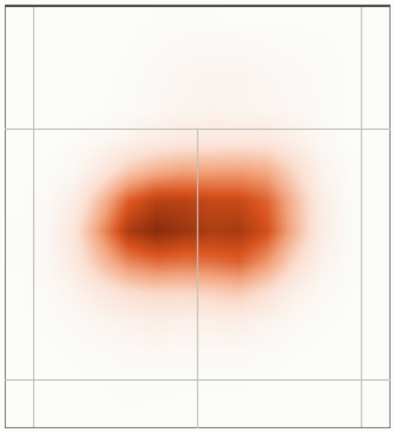

Game 1: You
near half | front 0% middle 95% back 5%

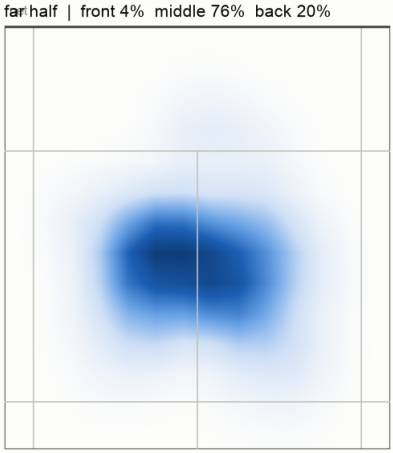

Game 1: Your partner
near half | front 5% middle 93% back 2%

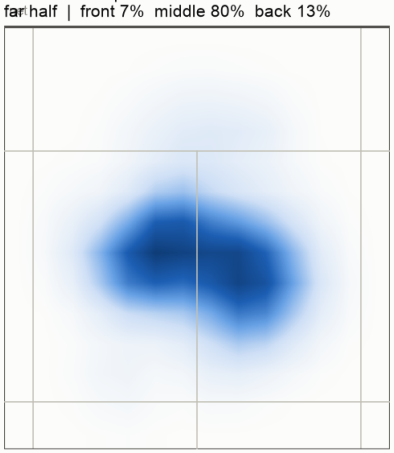

Game 1: both opponents
far half | 3.4 m from the net on average

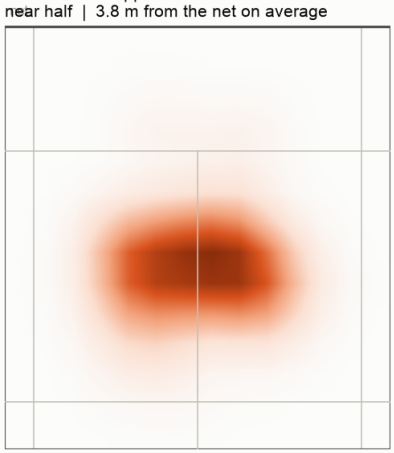

Game 2: You
far half | front 4% middle 76% back 20%

Game 2: Your partner
far half | front 7% middle 80% back 13%

Game 2: both opponents
near half | 3.8 m from the net on average

	Front court (net to 2.2 m)	Middle	Back court (4.5 m to baseline)	Left / middle / right
Game 1: You	0%	95%	5%	12% / 77% / 11%
Game 1: Partner	5%	93%	2%	12% / 69% / 19%
Game 2: You	4%	76%	20%	13% / 70% / 17%
Game 2: Partner	7%	80%	13%	13% / 71% / 17%

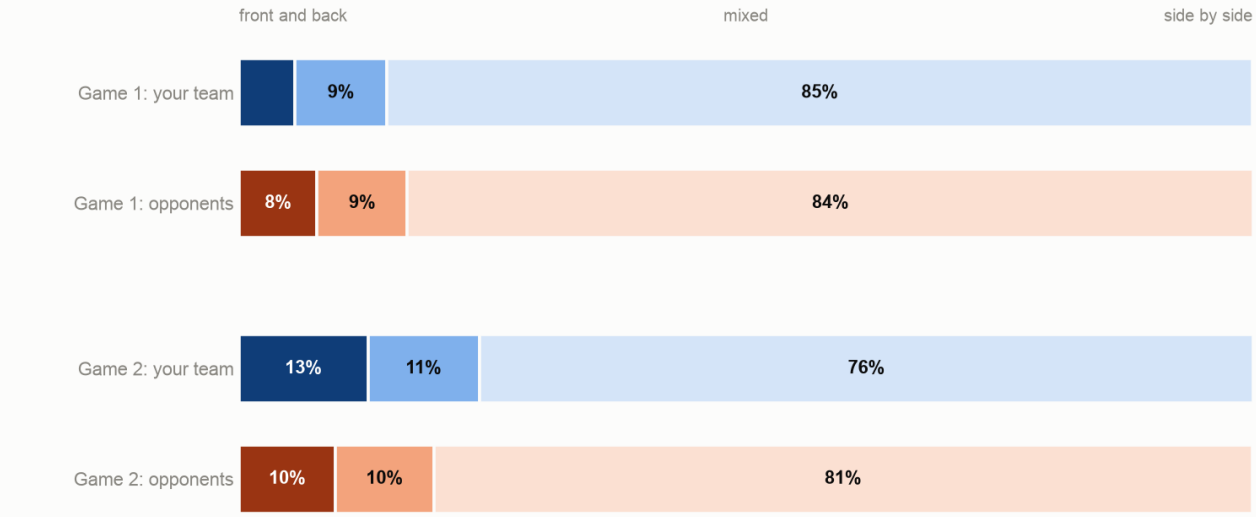

'Left' and 'right' are your own: left means your left when you face the net.

You and your partner

How the pair is arranged, who covers what, and how the work is shared.

How each pair stands

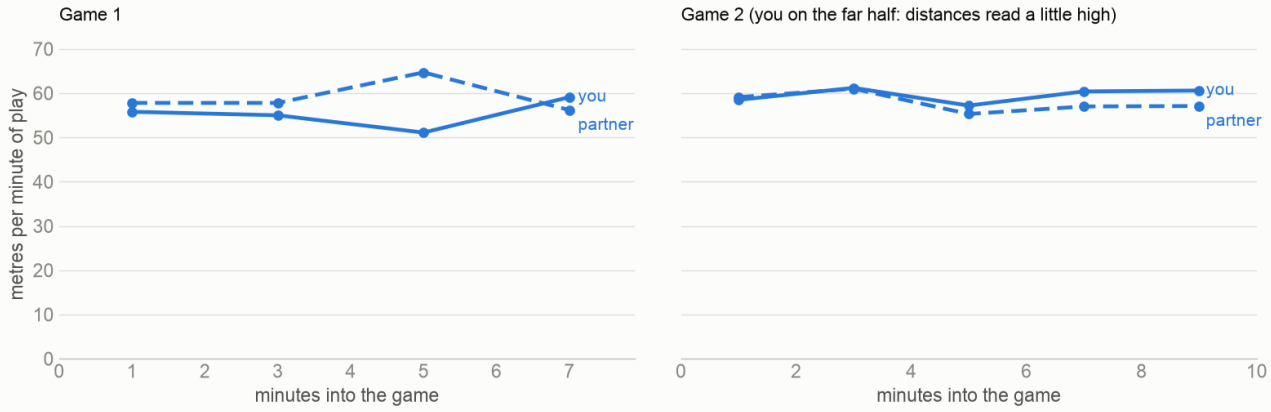

Share of play time: side by side (similar depth), mixed, or front and back (one at least 2.5 m deeper).

	Typical gap: depth / width	Within 1.5 m across	Partner at the back when front-and-back	Back-court swaps
Game 1	0.7 m / 1.4 m	55%	12%	1
Game 2	0.8 m / 1.4 m	55%	39%	4

How hard you worked, minute by minute

Metres moved per minute of play, in 2-minute blocks (blocks with under 30 s of play are left out).

Posture snapshot

From body-point tracking on the frames where each of you was close to the camera.

	Knee bent under 150 deg	Racket hand up between shots	Feet apart / shoulder width	Samples
Game 1: You	19%	82%	1.4	1281
Game 1: Partner	12%	88%	1.2	1262

'Racket hand up' means the wrist is above the hip, counted on the hand that goes overhead most often; you told us that is your right hand. The tracker's own left/right labels are mirrored for people seen from behind, so no handedness is read from them. A knee angle of 180 degrees is a straight leg.

The opponents

Where they stood and how they arranged themselves. Without a score this shows habits, not what won them points.

	Pair side by side / front and back	Typical gap: depth / width	Pair sits from the net	Moves per play-minute (each)
Game 1 (far)	84% / 8%	0.7 m / 1.5 m	3.4 m	60 and 61
Game 2 (near)	81% / 10%	0.7 m / 1.4 m	3.8 m	61 and 60

What they do well

1 **How they set up as a pair**

The two opponents stood side by side for 84% and 81% of play and front-and-back for 8% and 10%; they were within 1.5 m of each other across the court for 48% and 56% of the time. They defend as a tight pair around the middle.

Pair numbers from positions only: no shot data. Solid when they were near the camera, rougher when far.

Where they may be open

2 **Wide sidelines**

Because they bunch (within 1.5 m across for more than half the time), the outer 2 m or more on each side of their half is often unguarded.

Approximate; width is the more reliable direction of the tracking.

3 **The front court was left empty in game 2**

In game 2 the opponents spent only 3% to 6% of play in the front court (the first 2.2 m from the net) and stood on average 3.8 m from the net (your pair 3.8 m). If that is how they defend, short net shots and drops are the space they leave.

Position only: it does not show whether net shots won points against them.

A plan against them

4 **Test the space they leave**

Mix soft shots to the net and wide cross-court shots into your usual exchanges, and watch the longest plays listed at the end to see how they respond.

Try next time: Pick two plays per game to rewatch and note where each opponent was when you hit the shuttle.

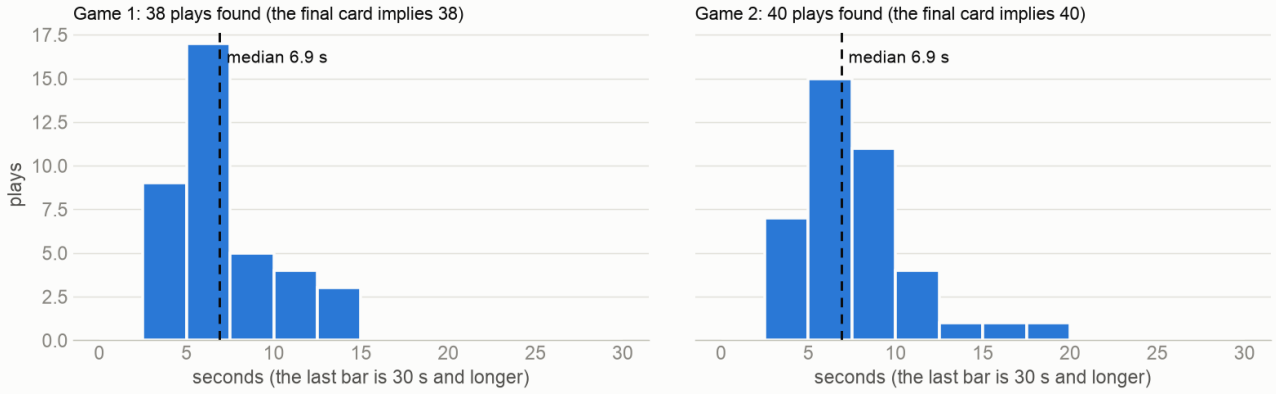

This is a hypothesis from positions only. The score is not in the video, so it cannot say which tactic won points.

Pace of play

How long plays and pauses lasted. These need the sound as well as the movement.

How long the plays lasted

Each bar counts plays of that length. A play is a stretch of movement and shuttle sound; two close rallies can merge.

Plays to watch back

The longest plays of each game, with the time in the video file. Long plays show how the two of you build or defend a point, so they are the best ones to rewatch for the questions in this report.

Game	Longest plays: starts at (lasts)
Game 1	3:21 (12 s), 4:29 (14 s), 4:47 (11 s), 5:19 (10 s), 6:17 (14 s), 7:14 (11 s), 7:42 (10 s), 8:07 (13 s)
Game 2	1:36 (16 s), 2:23 (12 s), 4:28 (12 s), 5:10 (10 s), 6:19 (10 s), 6:48 (15 s), 8:19 (11 s), 8:35 (18 s)

Times are minutes:seconds in the video file; a play can start a second or two earlier than shown. A very long play at the very start of a game can be a warm-up rally.

How sure

What was checked, what is approximate, and what this report does not measure.

What	How it was checked	How sure
Everything in this report	Invented. It describes no real match, so none of it can be checked against a video.	Not measured
Plays	In a real run these come from the shuttle sound and the players' movement.	Approximate
Plays found, Game 1	38 found; the result card 21-17 implies 38 (difference +0). The count can be right while single plays are merged or split.	Approximate
Plays found, Game 2	40 found; the result card 19-21 implies 40 (difference +0). The count can be right while single plays are merged or split.	Approximate
Winners, serves, shots, errors	Not in the video: there is no scoreboard and no shuttle tracking.	Not measured
Distance, far-half players	Seen small, so tracking jitter adds distance: compare players on the same side, not near with far.	Approximate
