How sure is each number? . . . 12
Appendix: reading the numbers . . . 13

How sure should you be?

Positions, distances, speeds and rally times are measured from the video. Who won each rally is inferred from the scoreboard and from how the players stand: 30 of 53 rallies are independently confirmed.

This is one game with about 50 rallies, so small differences cannot be detected. Treat every pattern as a question to check on video (times are given), not a verdict. The 'How sure' page near the end shows how sure each part is.

The match

How the game unfolded, rally by rally.

Match at a glance

Doubles, one game. Your team = you in the white tee and your partner in the red shirt.

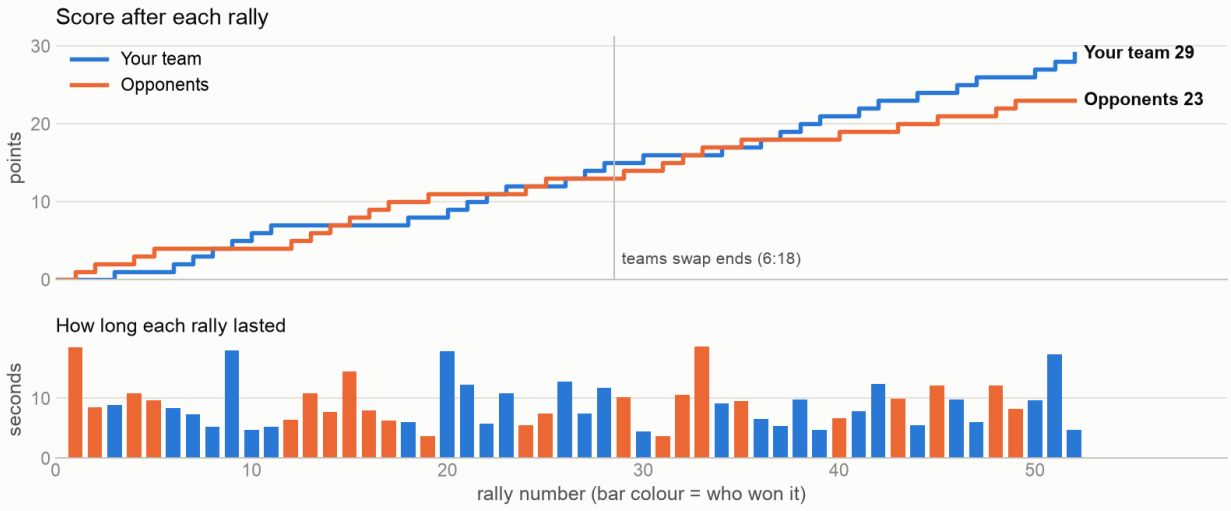

29-23

ties / lead changes

6
longest run (yours 6 from 2:01, theirs 6 from 3:05)

9.4 s
average rally, median 8.5 s

reference match, doubles. Numbers are estimates from video. The winner of the last rally is not shown in the video.

Points won by your team, by quarter of the game	7 of 13, 6 of 13, 8 of 13, 8 of 13
Longest run, your team	6 points from rally 6 at 2:01
Longest run, opponents	6 points from rally 12 at 3:05
Ties and lead changes	8 ties, 7 lead changes
Teams swapped ends	at 6:18

Your coaching plan

Written by an AI assistant from the numbers in this report. Each point cites a number, gives video times to check and says how sure it is. They are ideas to test on court, not verdicts; advice the video cannot test is labelled as general advice.

How to use this plan

Watch the clips under 'Moments to check' before you decide anything. Pick one or two points under 'What to work on', not all of them. Film your next game from the same spot and run the analysis again; compare the same numbers.

What to work on

Ordered by how well the video supports them.

1 Look at your own serve

Your team won 4 of the 10 rallies you served, against 9 of the 13 your partner served. Overall your team won 17 of 28 rallies on serve (61%), so the team's serving record is not weak overall.

Try next time: Watch your six lost serves and ask: is it too high, too predictable, or is the third shot the problem? Change one thing next game (height, placement or the plan for the third shot) and count again. General advice, not tested by this video: mixing a short serve with a flick serve makes the receiver's first move harder to guess.

Watch your lost serves: 1:35 (R4), 4:23 (R19), 6:24 (R29), 7:36 (R35), 9:00 (R43), 9:56 (R48).

How sure: low. Ten serves is a hint, not proof (p about 0.22), and who served is inferred from where the players stand.

2 Have a plan for the long rallies

Your team won 10 of 13 rallies under 6 s (77%) but only 19 of 39 longer ones (49%), and 8 of 17 over 10 s (47%). The video cannot show which shots were played.

Try next time: Agree what you do when the first attack does not end the point: where you reset the rally (a clear to the back, a lift to the middle), and who covers the net. General advice; then check whether the long-rally record moves in your next game.

Watch the long rallies you lost: 0:51 (R1, 18 s), 3:38 (R15, 14 s), 7:03 (R33, 19 s), 9:20 (R45, 12 s).

How sure: low to medium. 13 short rallies against 39 longer ones, p about 0.11.

3 Ready stance: get lower

Your legs were nearly straight (knees not bent below 150 degrees) in 82% of the frames where you were near the camera; your typical knee angle was 166 degrees against 168 for your partner. Posture was the same in won and lost rallies (bent in 17% and 18% of frames).

Try next time: General advice, not tested by this video: a bent-knee ready position usually gives a quicker first step. Next game, the share of bent-knee frames is the number to move.

Watch your stance in any rally after 6:19, when you are on the near side of the court.

How sure: medium for the measurement (1,926 frames of you in 25 rallies, near half only). Whether a lower stance wins you more points is not tested here.

Questions to check on the video

The data hints at these but cannot settle them: watch the clip before changing anything.

4 A question for the video: stay compact?

You and your partner were within 1.5 m of each other 26% of the time in rallies you won and 16% in rallies you lost (p = 0.03). It is one of nine comparisons, so about one result like this is expected by chance, and on each half of the court alone it is not significant (p = 0.12 and 0.17).

Try next time: Watch the clips and see whether being far apart left a gap the opponents used. If it did, agree who takes the middle.

Watch the lost rallies where you two were furthest apart: 4:23 (R19), 1:12 (R2), 9:00 (R43), 9:20 (R45).

How sure: lowest. One small p among nine; tracking is weakest when players overlap.

What is working

Keep doing these.

5 Your team wins the quick points

Your team won 10 of 13 rallies that ended within 6 seconds (77%).

Try next time: Keep attacking the first loose ball. General advice: when a point is going your way early, do not slow it down.

Watch some of them: 2:22 (R8), 2:50 (R10), 2:57 (R11), 5:04 (R22), 6:37 (R30), 7:57 (R37).

How sure: low to medium. 13 short rallies; p about 0.11.

6 Running is not what separates won from lost rallies

You covered 400 m, the most of the four players (your partner 392 m, the opponents 325 m and 377 m). Per rally you ran 8.0 m in won and 7.7 m in lost rallies, at 0.91 and 0.83 m/s, and spent 12% and 16% of the time at the back (all p above 0.2).

Nothing to fix here: this is not a fitness problem.

How sure: medium. Small effects could hide in 28 won and 23 lost rallies; far-court distances are rougher.

7 A steady game from start to finish

Your team won 7, 6, 8 and 8 of 13 rallies in the four quarters of the game. The score was tied 8 times with 7 lead changes, and your team led 29-23 before the last rally. Your best run was 6 points from 2:01.

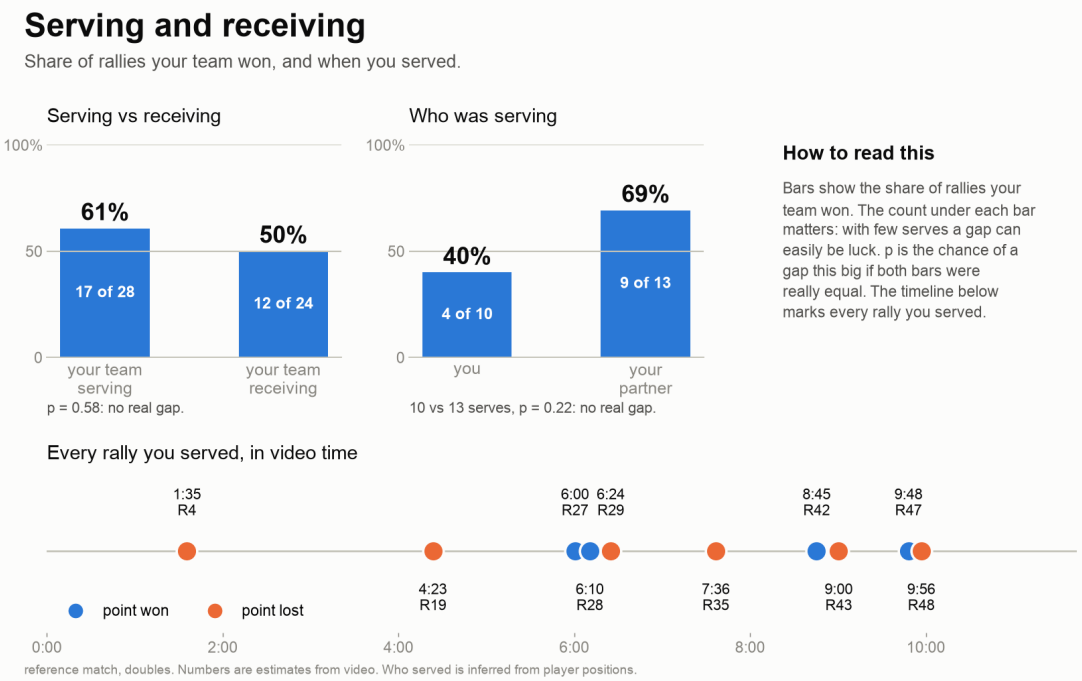

Watch your run from 2:01 (R6) to see what worked.

How sure: high. This is read straight from the scoreboard.

How you played

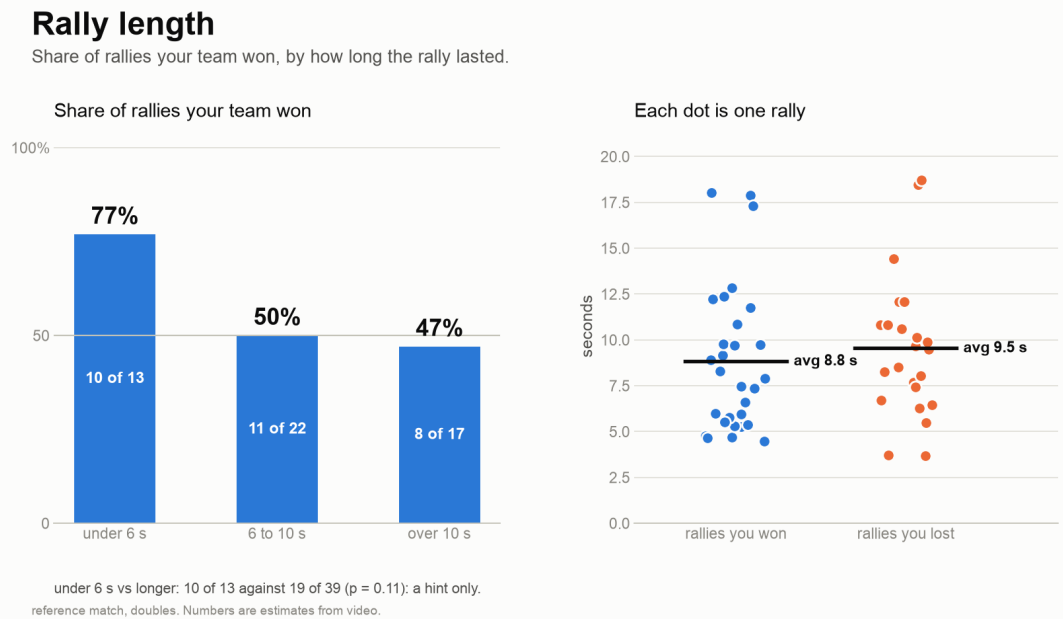

The charts behind the coaching plan, each with what it says in plain words.

Serving and receiving

- When your team served it won 17 of 28 (61%) of rallies; when receiving, 12 of 24 (50%). No real gap: luck alone explains this.
- You won 4 of 10 (40%) of the rallies you served, your partner 9 of 13 (69%). A handful of serves is too few to call a difference.

Rally length

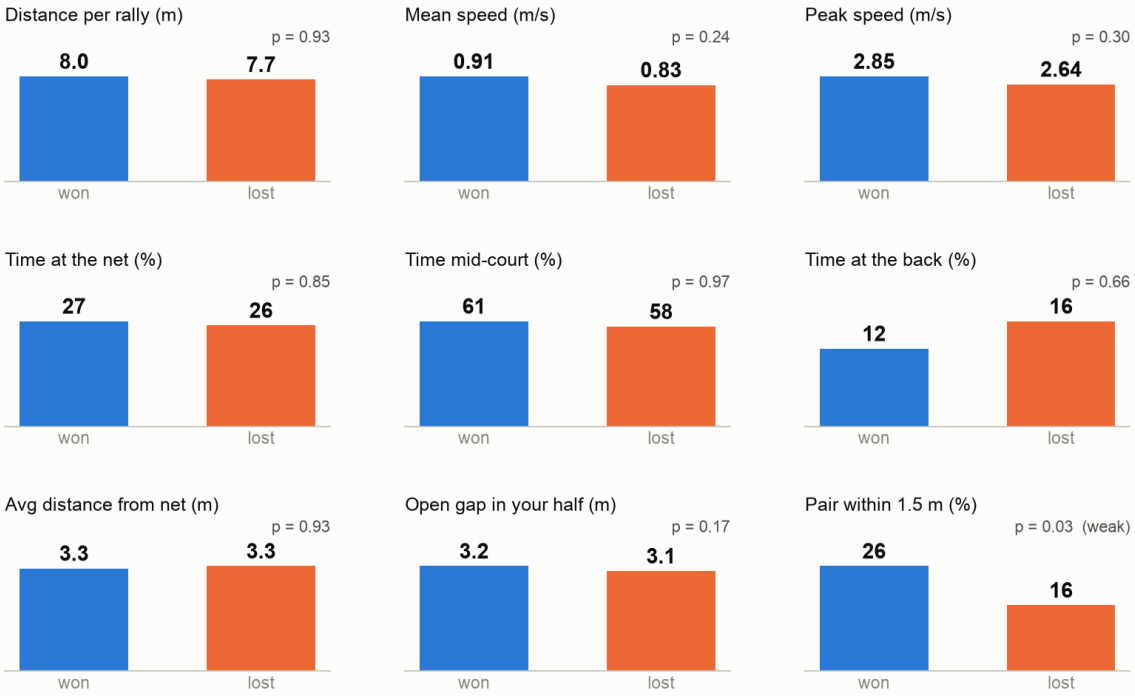

- Rallies under 6 seconds: your team won 10 of 13 (77%). Longer rallies: 19 of 39 (49%).
- Average rally: 8.8 s when you won, 9.5 s when you lost.

Movement: rallies won versus lost

You: rallies won vs lost

28 won and 23 lost rallies. Bars are averages.

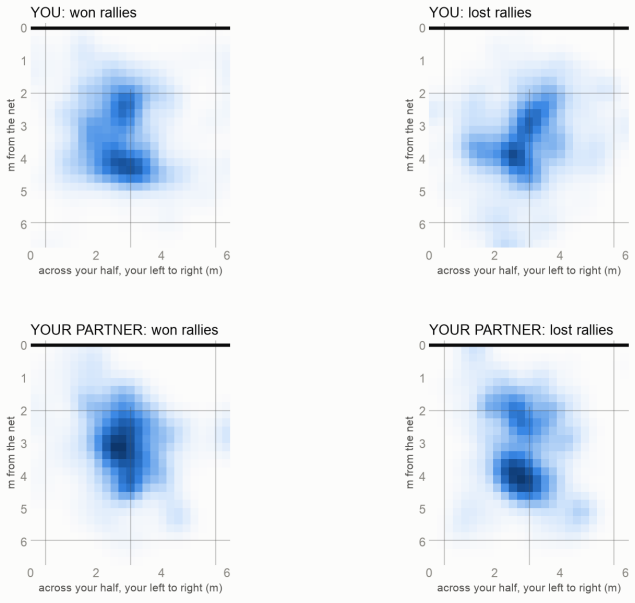

p: chance of a difference this big if won and lost rallies were the same (small = real). With 9 comparisons one p under 0.05 is expected by chance, so a lone small p is a question for the video, not a finding. Blue = rallies your team won, orange = lost.

- 1 of the 9 comparisons has p below 0.05: time within 1.5 m of your partner (p = 0.03). With 9 comparisons about one is expected by chance, so treat it as a question for the video, not a finding.
- Over the game you ran 400 m (7.8 m per rally); your partner 392 m.

Where you and your partner stood

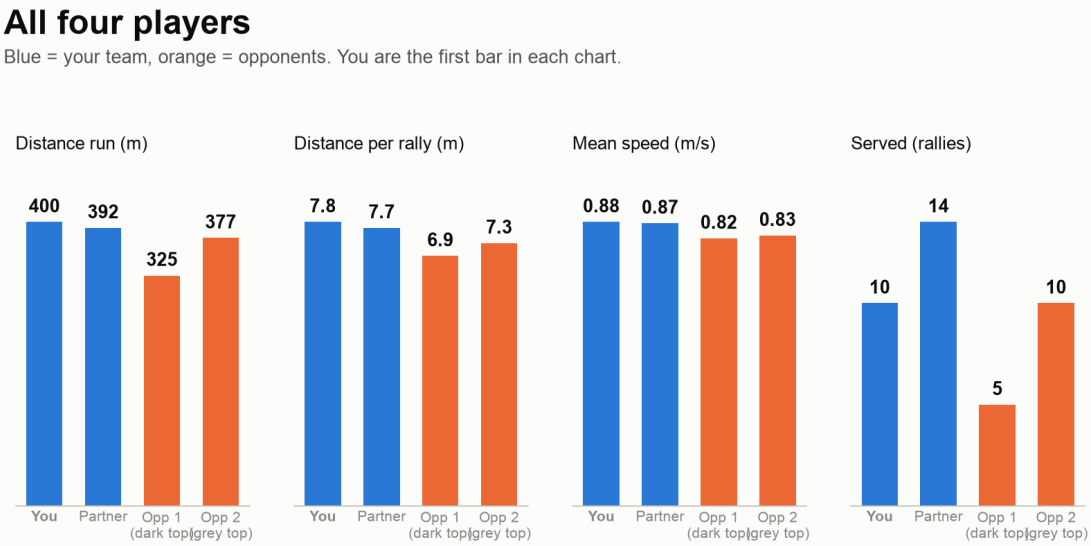

Where you and your partner stood

Own half of the court seen from behind your team, net at the top. Darker = more time.

Court coordinates from the camera calibration. Parts of the court outside the camera view are under-counted. Same colour scale in all four maps.

All four players

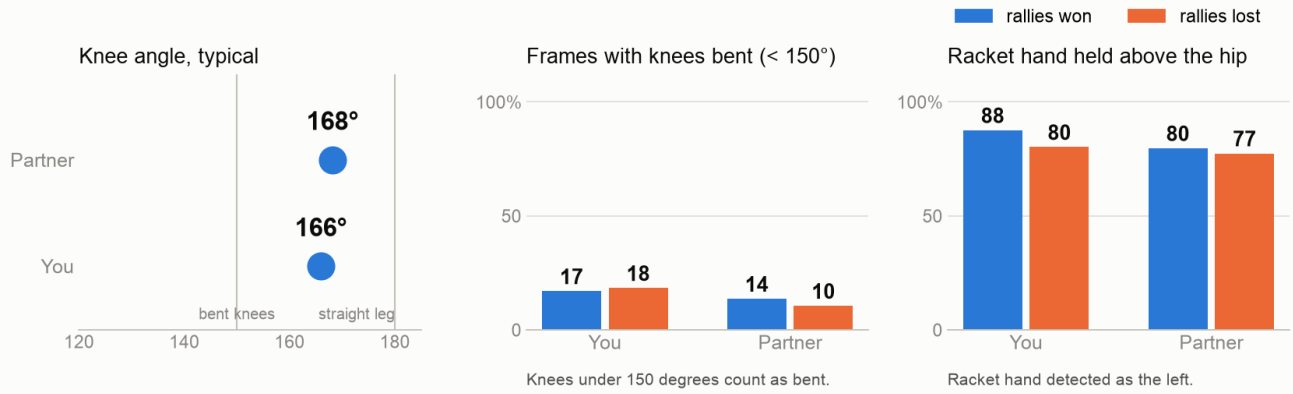

Tracked in you 96%, partner 95%, opp 1 90%, opp 2 91% of frames. 'Served' counts rallies where the server could be identified (39 of 53).

reference match, doubles. Numbers are estimates from video.

Posture

Body landmarks need a large person, so this only works while a player is near the camera.

You: knees bent in 18% of frames vs 12% for your partner; racket hand up 84% (partner 79%).

reference match, doubles. Numbers are estimates from video. Charts only: no photographs.

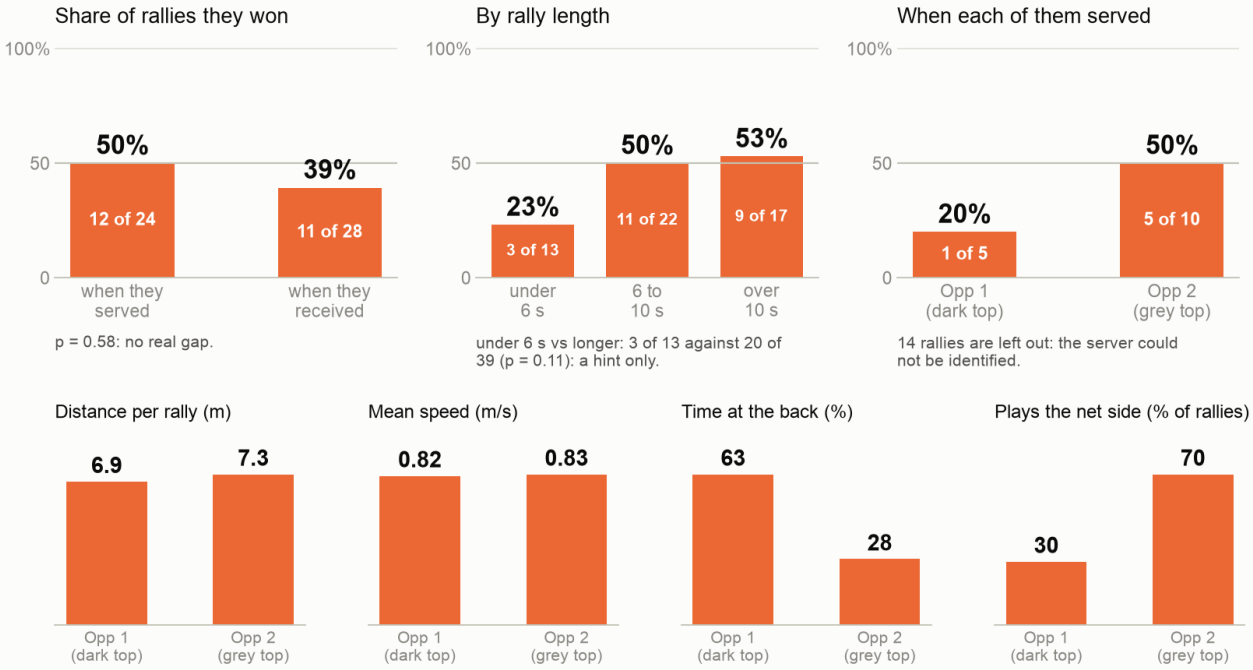

- Knees were bent (under 150 degrees) in 18% of your frames and 12% of your partner's; a straight leg is 180 degrees and your typical angle was 166 degrees.
- Your racket hand (left) was held above the hip in 84% of frames (partner 79%). The hand is guessed from a small number of overhead frames: check it on a few swings.

Scouting the opponents

What the video can say about the other team. There is no shuttle tracking, so this is about results, tempo and where they stood, not shot types or where the shuttle landed.

The opponents

Orange = the opponents. How they did, and how they moved.

reference match, doubles. Numbers are estimates from video. Time at the back and net side use the 28 rallies where they were on the near half (far-half depth is less reliable).

	Opponent 1 (dark top)	Opponent 2 (grey top)
Distance per rally	6.9 m	7.3 m
Mean speed	0.82 m/s	0.83 m/s
Net / mid / back (28 near-half rallies)	6% / 31% / 63%	29% / 43% / 28%
Nearer the net than their partner	30% of rallies	70% of rallies
Points won on their own serve	1 of 5 (20%)	5 of 10 (50%)
Racket hand (a guess)	right (fairly clear: 8 right vs 3 left overhead frames of 11)	left (unclear: 8 right vs 16 left overhead frames of 24)
Knees bent under 150 degrees	12% of frames	13% of frames

- When serving the opponents won 12 of 24 (50%); when receiving, 11 of 28 (39%). No real gap: luck alone explains this.
- Rallies under 6 seconds: they won 3 of 13 (23%). Longer rallies: 20 of 39 (51%). That gap is a hint only; luck alone could produce it.
- Their longest run was 6 points from rally 12 at 3:05.
- Their pair stood side by side 6% of the time in rallies they won and 15% in rallies they lost (p = 0.04, one of 5 comparisons).

What they do well

Where they were hard to beat in this game.

1 Once a rally settles, they are an even match

In rallies longer than 6 seconds the opponents won 20 of 39 (51%), including 9 of 17 over 10 seconds (53%).

Long rallies they won: 7:03 (R33, 19 s), 0:51 (R1, 18 s), 3:38 (R15, 14 s), 9:56 (R48, 12 s).

How sure: low to medium. 39 rallies; the video cannot show which shots decided them.

2 Opponent 2 plays the net and does most of the serving

Opponent 2 (grey top) won 5 of the 10 rallies they served and was the player nearer the net in 70% of the 28 rallies when the opponents were near the camera. Opponent 2 ran 7.3 m per rally against 6.9 m for Opponent 1.

Opponent 2's serves: 0:51, 1:24, 3:27, 3:55, 4:14, 5:34, 6:50, 7:24, 8:34, 9:35.

How sure: low. 10 serves and 28 rallies; who served is inferred.

3 They can string points together

Their best run was 6 points, from rally 12 at 3:05, the same length as your best run.

Watch rallies 12 to 17, 3:05 to 4:05, to see what changed.

How sure: high that it happened (scoreboard); why it happened is not visible.

Possible openings

Hints from this one game; none of them is proven.

4 Quick points go against them

The opponents won only 3 of the 13 rallies that ended within 6 seconds (23%), against 20 of 39 longer ones (51%). This is the same finding as your quick-point record, seen from their side.

Short rallies your team won: 2:22 (R8), 2:50 (R10), 2:57 (R11), 5:04 (R22), 6:37 (R30), 7:57 (R37).

How sure: low to medium. 13 short rallies, p about 0.11.

5 A little weaker when receiving, but not clearly

They won 11 of 28 rallies (39%) when receiving and 12 of 24 (50%) when serving ($p = 0.58$).

How sure: low. No real gap: do not build a plan on this.

6 Opponent 1's serve rarely paid off

Opponent 1 (dark top) won 1 of the 5 rallies they served; Opponent 2 won 5 of 10. In 14 rallies the server could not be identified.

Opponent 1's serves: 1:49 (R5, theirs), 2:01 (R6), 4:29 (R20), 9:12 (R44), 10:22 (R50).

How sure: very low. Five serves.

7 A question for the video: side-by-side defence

Their pair stood side by side 6% of the time in rallies they won and 15% in rallies they lost ($p = 0.04$). It is one of five comparisons, so a result like this can easily be chance.

Rallies they lost while most side by side: 2:12 (R7), 6:10 (R28), 8:18 (R39), 10:54 (R52).

How sure: lowest. One small p among five, and positions of overlapping players are the roughest.

8 **Their side lanes were thinly covered**

In the 28 rallies when they were near the camera, at least one of them stood within 1.5 m of the middle of the middle lane for 81% of the time in mid-court and 74% at the back. The left and right lanes were covered only about 20% of the time, and the front corners 3% and 7%. This shows where they stood, not where they lost points.

How sure: low to medium. Positions are good near the camera but this is one game and says nothing about shot placement.

Game plan to try

Ideas to test next time you play them. The video cannot prove they work.

9 **Try to finish early**

They struggle most in rallies under 6 seconds. Attack the first loose ball instead of resetting, and count how many of your next game's rallies end early and who wins them.

Built on a low-confidence hint (p about 0.11): a test to run, not a rule.

10 **Test the side lanes and back corners**

They mostly held the middle lane. Try placing some shots wide and deep and watch whether they are stretched. The video cannot say where your shots landed, so note it yourself.

A test to run: the video shows where they stood, not where points were lost.

11 **Be patient in long rallies**

In rallies over 6 seconds they win about half, so they are as good as you there. Have your reset plan ready (see your coaching plan) and avoid gambling when the rally is level.

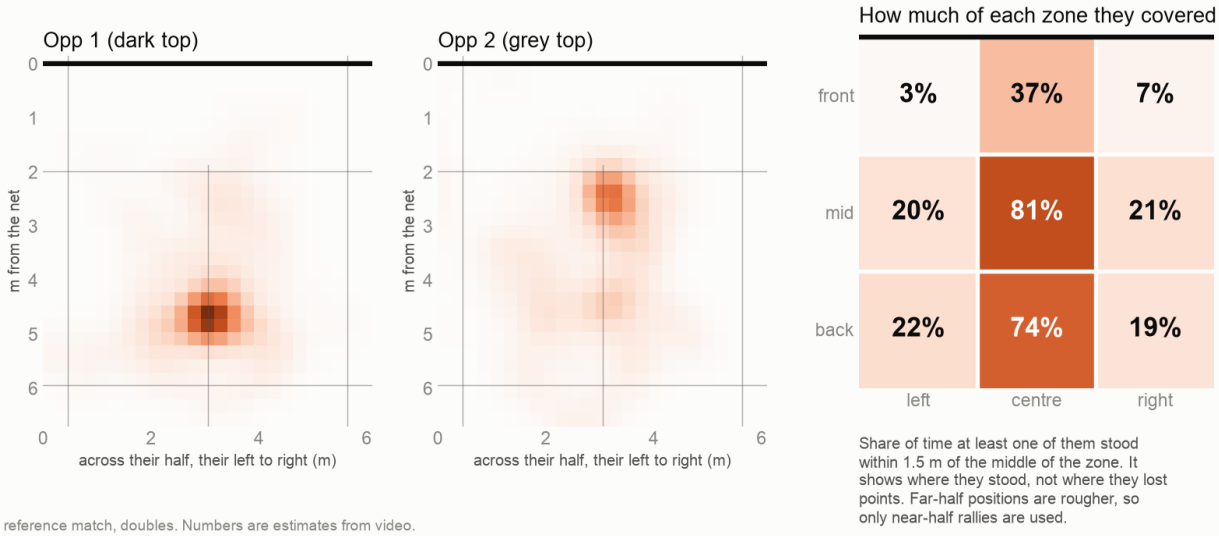

General advice backed by the long-rally record above.

12 **Check which hand each of them uses**

The program guessed Opponent 1 right-handed (8 of 11 overhead frames) and Opponent 2 left-handed (16 of 24, not clear). Left- and right-handers have different backhand corners; confirm on the video before you plan around it.

How sure: low. A few dozen frames.

Where the opponents stood

- The middle lane was covered most: at least one of them stood near it 81% of the time in mid-court and 74% at the back. The two side lanes were covered least (20% and 21% in mid-court). That shows where they stood, not where they lost points.

> **What the video cannot tell us about the opponents**
>
> Shot types, where the shuttle landed, who made the error, whether a player is tired (the camera sees the two halves differently), or anything about how they play against other opponents. Racket hand and knee bend come from a few dozen frames at most.

Moments to check on the video

In order of video time. Open the clip at these times and see whether the numbers match what you saw.

Moments to check on the video

In order of video time. Open the clip at these times and see if the numbers match what you saw.

TIME	RALLY	WHAT TO LOOK AT	CONTEXT
0:51	R1	long rally lost (18 s)	score 0-0
1:35	R4	you served, point lost	score 1-2
2:01	R6	your 6-point run starts	what worked?
3:05	R12	opponents' 6-point run starts	what changed?
3:38	R15	long rally lost (14 s)	score 7-7
4:23	R19	you served, point lost	score 8-10
6:24	R29	you served, point lost	score 15-13
7:03	R33	long rally lost (19 s)	score 16-16
7:36	R35	you served, point lost	score 17-17
9:00	R43	you served, point lost	score 23-19
9:56	R48	you served, point lost	score 26-21

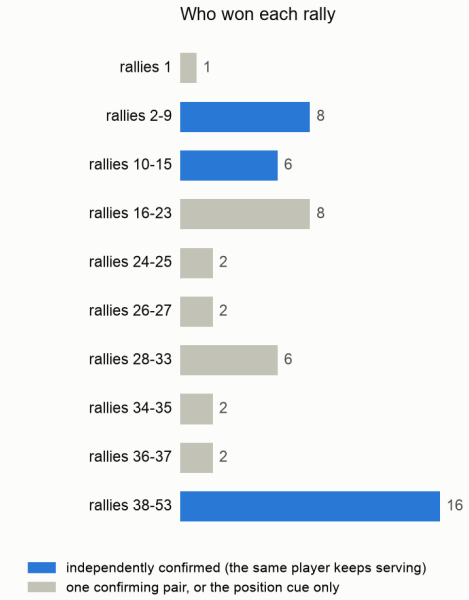

Orange dot = a point your team lost (or the opponents' run), blue dot = something that worked for your team.

How sure is each number?

Left: how well each block of rallies is backed up. Right: the check run at every stage.

How sure is each number?

Left: how well each block of rallies is backed up. Right: the check run at every stage.

Stage	Result
0 proxy video	**PASS** 7 of 7 automatic checks
1 person detection	**PASS** 6827 sampled frames
2 court calibration	**PASS** fit error 1.9 px
3 player tracking	**PASS** 90% to 96% of frames
4 serves	**PASS** quadrants occupied in 70% of windows
5 score replay	**PASS** 0 mismatches with the scoreboard
6 rally boundaries	**PASS** 53 rallies, 4 to 21 s
7 movement	**PASS** 51 rallies compared
8 posture	**PASS** near half only
9 shuttle pickups	**NOT USED** 8 of 18 point at the loser (chance)

Far-court positions are less precise than near-court ones; parts of the court outside the camera view are under-counted.

What limits these numbers

- Who won each rally is inferred: the scoreboard shows the server's score, not the team. Independent confirmation covers 30 of 53 rallies; in the independent test the same player kept serving in 11 of 11 pairs, against 0 of 26 if the inference were backwards.
- Far-court positions are rougher: the camera sees about 175 pixels per metre near the camera but only 18 at the far end, so far-half positions (and anything that depends on depth there) are less precise.
- Tracking coverage per player: A_partner 95%, A_you 96%, B_opp1 90%, B_opp2 91% of frames.
- The last rally is left out of per-rally statistics: after the final point the players keep moving.
- No shuttle tracking: shot types, smash counts and landing spots are not measured.
- One game, about 50 rallies: most comparisons cannot detect small effects, and with many comparisons some p below 0.05 are expected by chance.
- Posture only works while a player is near the camera; opponent posture rests on a few dozen frames.

Appendix: reading the numbers

p-value	The chance of a gap this big if there were really no difference. Small means a real difference is more likely. Below 0.01 reads 'probably real', 0.01 to 0.05 'suggestive', 0.05 to 0.2 'a hint only', above 0.2 'no real gap'. It says nothing about why.
Rally	From the moment the serve is set up to the end of the point, found from the player positions and the scoreboard.
Net / mid / back	How far a player stood from the net: up to 2.5 m, 2.5 to 4.5 m, beyond 4.5 m.
Open gap	The widest stretch of a team's half, across the court, with nobody in it.
Within 1.5 m	The share of time the two partners stood closer than 1.5 m to each other.
Side by side / front-back	Partners at least 2 m apart sideways and within 2 m of the net: side by side; at least 2 m apart in depth and within 2 m sideways: front-back.
Measured / inferred	Measured: positions, distance, speed, posture. Inferred: who served and who won each rally.

How this report was made

The video was analysed on one computer with free, open-source tools: a person detector and a pose model (Ultralytics YOLO), the court fitted to hand-picked points, and the scoreboard read by text recognition. The coaching and scouting words were written by an AI assistant from the numbers. The video was never uploaded by the program. This PDF contains charts only, no photographs of people.

Badminton Analysis is alpha software, licensed AGPL-3.0: github.com/setuparimi/ai-badminton-analysis. It was checked end to end on only a few videos, so treat its output as a measurement with error bars.
